Chromatic scale

The following scheme shows up and downwards the names of all notes (naturals, altered and enharmonics).

→	C#	→	D#	→	→	F#	→	G#	→	A#	
C		D		E	F		G		A		B
	Db	←	Eb	←	←	Gb	←	Ab	←	Bb	←

The central line shows the **natural** notes.
The line above shows the notes altered with **sharps**, this means that the scale moves upwards.
The lower line shows the notes altered with **flats**, this means that the scale moves downwards.
The notes that are exactly above another are the **Enharmonics.**
All natural notes have a distance of **1 step** in between, except (**E - F**) and (**B - C**), which only have **½ step** distance in between, thus they're not altered.
If they were to be altered, the following enharmonics would appear:

(E# = F) or **(Fb = E)**
(B# = C) or **(Cb = B)**

There's a total of 12 notes in the chromatic scale, 7 are natural and 5 are altered (**#** when going up or **b** when going down).
When the scale is completed (regardless in which direction), this one will start a new cycle, and then another, and another, until the point where our ears stop hearing.
Each one of this cycles is called **Octave.**
